Several Formalisations:

- Malcolm.
- 2 Hartshorne.
- Intinga.
- Sobel.
- Gödel.

Most of them concerned with modal approach. But we focus on Proslogion II which is more dependent on the logic of DD than on modal logics. Some approaches to Proslogion II in this style: Barnes, Oppenheimer and Zalta (OZ formalisation).

< ロ > < 同 > < 回 > < 回 > < 回 > <

Proslogion II (translated by Mann):

< 同 > < 国 > < 国 >

Proslogion II (translated by Mann):

- Thus even the fool is convinced that something than which nothing greater can be conceived is in the understanding, since when he hears this, he understands it; and whatever is understood is in the understanding. (II.8)
- And certainly that than which a greater cannot be conceived cannot be in the understanding alone. (II.9)
- For if it is even in the understanding alone, it can be conceived to exist in reality also, which is greater. (II.10)
- Thus if that than which a greater cannot be conceived is in the understanding alone, then that than which a greater cannot be conceived is itself that than which a greater can be conceived. (II.11)
- But surely this cannot be. (II.12)
- Thus without doubt something than which a greater cannot be conceived exists, both in the understanding and in reality. (II.13)

Preliminary remarks on interpretation:

1. Differences between: 'understands', 'in the understanding', 'conceived'. Following Barnes we can unify them.

- 1. Differences between: 'understands', 'in the understanding', 'conceived'. Following Barnes we can unify them.
- 2. Difference between 'id quo' and 'aliquid quo' in descriptions:

- 1. Differences between: 'understands', 'in the understanding', 'conceived'. Following Barnes we can unify them.
- 2. Difference between 'id quo' and 'aliquid quo' in descriptions:
- Some deny that in AA we have DD at all (Lewis, Eder).

- 1. Differences between: 'understands', 'in the understanding', 'conceived'. Following Barnes we can unify them.
- 2. Difference between 'id quo' and 'aliquid quo' in descriptions:
- Some deny that in AA we have DD at all (Lewis, Eder).
- Some differentiate between indefinite (aliquid quo) and definite description (id quo) in AA (Barnes, OZ).

Ontological Argument

Preliminary remarks on interpretation:

- 1. Differences between: 'understands', 'in the understanding', 'conceived'. Following Barnes we can unify them.
- 2. Difference between 'id quo' and 'aliquid quo' in descriptions:
- Some deny that in AA we have DD at all (Lewis, Eder).
- Some differentiate between indefinite (aliquid quo) and definite description (id quo) in AA (Barnes, OZ).

3. (a) 'can be conceived' or (b) 'conceivable' – to separate modal aspect or to embed it;

Ontological Argument

Preliminary remarks on interpretation:

- 1. Differences between: 'understands', 'in the understanding', 'conceived'. Following Barnes we can unify them.
- 2. Difference between 'id quo' and 'aliquid quo' in descriptions:
- Some deny that in AA we have DD at all (Lewis, Eder).
- Some differentiate between indefinite (aliquid quo) and definite description (id quo) in AA (Barnes, OZ).
- 3. (a) 'can be conceived' or (b) 'conceivable' to separate modal aspect or to embed it;
- OZ choose (b),

Preliminary remarks on interpretation:

- 1. Differences between: 'understands', 'in the understanding', 'conceived'. Following Barnes we can unify them.
- 2. Difference between 'id quo' and 'aliquid quo' in descriptions:
- Some deny that in AA we have DD at all (Lewis, Eder).
- Some differentiate between indefinite (aliquid quo) and definite description (id quo) in AA (Barnes, OZ).

3. (a) 'can be conceived' or (b) 'conceivable' – to separate modal aspect or to embed it;

OZ choose (b), I prefer (a) since it helps to treat 'is conceived' and 'is in the understanding' as synonyms and, in accordance with Anselm's conviction, makes the presence of the concept of God in the fool's understanding not something which is just possible but which simply holds – 'Thus even the fool is convinced...'

Preliminary remarks on interpretation:

- 1. Differences between: 'understands', 'in the understanding', 'conceived'. Following Barnes we can unify them.
- 2. Difference between 'id quo' and 'aliquid quo' in descriptions:
- Some deny that in AA we have DD at all (Lewis, Eder).
- Some differentiate between indefinite (aliquid quo) and definite description (id quo) in AA (Barnes, OZ).

3. (a) 'can be conceived' or (b) 'conceivable' – to separate modal aspect or to embed it;

OZ choose (b), I prefer (a) since it helps to treat 'is conceived' and 'is in the understanding' as synonyms and, in accordance with Anselm's conviction, makes the presence of the concept of God in the fool's understanding not something which is just possible but which simply holds – 'Thus even the fool is convinced...'

4. 'conceived' as applied to (a) objects or to (b) states;

Preliminary remarks on interpretation:

- 1. Differences between: 'understands', 'in the understanding', 'conceived'. Following Barnes we can unify them.
- 2. Difference between 'id quo' and 'aliquid quo' in descriptions:
- Some deny that in AA we have DD at all (Lewis, Eder).
- Some differentiate between indefinite (aliquid quo) and definite description (id quo) in AA (Barnes, OZ).

3. (a) 'can be conceived' or (b) 'conceivable' – to separate modal aspect or to embed it;

OZ choose (b), I prefer (a) since it helps to treat 'is conceived' and 'is in the understanding' as synonyms and, in accordance with Anselm's conviction, makes the presence of the concept of God in the fool's understanding not something which is just possible but which simply holds – 'Thus even the fool is convinced...' 4. 'conceived' as applied to (a) objects or to (b) states; Barnes prefers (b) but using DD helps to avoid this problem and takes (a) as the only one required.

Ontological Argument

How to characterise God?

Andrzej Indrzejczak Russellian Logic of Definite Descriptions and Anselm's God

In general by DD $i x \varphi_i(x)$, where

Andrzej Indrzejczak Russellian Logic of Definite Descriptions and Anselm's God

イロト イヨト イヨト

In general by DD $ix\varphi_i(x)$, where 1. in OZ: $\varphi_1(x) := Cx \land \neg \exists y (Gyx \land Cy)$ and Cx = x is conceivable Gyx = y is greater than x.

In general by DD $ix\varphi_i(x)$, where 1. in OZ: $\varphi_1(x) := Cx \land \neg \exists y (Gyx \land Cy)$ and Cx = x is conceivable Gyx = y is greater than x. 2. in my formalisation: $\varphi_2(x) := \neg \exists y (Gyx \land \diamondsuit Cy)$ and Cx = x is conceived

In general by DD $ix\varphi_i(x)$, where 1. in OZ: $\varphi_1(x) := Cx \land \neg \exists y (Gyx \land Cy)$ and Cx = x is conceivable Gyx = y is greater than x. 2. in my formalisation: $\varphi_2(x) := \neg \exists y (Gyx \land \diamondsuit Cy)$ and Cx = x is conceived 3. Barnes is using $ix \neg \exists yyI$: Gzx, where $xI : \varphi = x$ can imagine (conceive) that φ (paramodal binary operator)

II.8:

Andrzej Indrzejczak Russellian Logic of Definite Descriptions and Anselm's God

ヘロト ヘロト ヘヨト ヘヨト

Thus even the fool is convinced that something than which nothing greater can be conceived is in the understanding, since when he hears this, he understands it; and whatever is understood is in the understanding.

< 同 > < 国 > < 国 >

Thus even the fool is convinced that something than which nothing greater can be conceived is in the understanding, since when he hears this, he understands it; and whatever is understood is in the understanding.

Schematically *A*; it is the first premiss of AA which is supported by subordinate argument which summarises the content of sentences 1-7 of chapter II ('since ... understanding.')

< 同 > < 国 > < 国 >

Thus even the fool is convinced that something than which nothing greater can be conceived is in the understanding, since when he hears this, he understands it; and whatever is understood is in the understanding.

Schematically A; it is the first premiss of AA which is supported by subordinate argument which summarises the content of sentences 1-7 of chapter II ('since ... understanding.')

In OZ: $\exists x \varphi_1(x)$

ヘロア 人間 アメヨア メヨア

II.9:

And certainly that than which a greater cannot be conceived cannot be in the understanding alone.

ヘロマ ヘビマ ヘビマ

11.9:

And certainly that than which a greater cannot be conceived cannot be in the understanding alone.

Schematically $\Box \neg \diamondsuit (A \land \neg B)$.

ヘロト ヘヨト ヘヨト

11.9:

And certainly that than which a greater cannot be conceived cannot be in the understanding alone.

Schematically $\Box \neg \Diamond (A \land \neg B)$. This is just a statement of what is supposed to be shown.

(人間) シスヨン イヨン

II.9:

And certainly that than which a greater cannot be conceived cannot be in the understanding alone.

Schematically $\Box \neg \Diamond (A \land \neg B)$. This is just a statement of what is supposed to be shown.

There are modal notions (we treat 'certainly' as expressing necessity of this statement) but not essential; modal operators in the prefix have rather a rhetoric value; they serve to emphasize that what is expressed in their scope is not possible. After using modal principle T (the medieval principle *ab necesse ad esse valet consequentia*), the interdefinability of \Box and \Diamond and propositional logic, we obtain simply $A \rightarrow B$.

ヘロト ヘヨト ヘヨト

II.9:

And certainly that than which a greater cannot be conceived cannot be in the understanding alone.

Schematically $\Box \neg \Diamond (A \land \neg B)$. This is just a statement of what is supposed to be shown.

There are modal notions (we treat 'certainly' as expressing necessity of this statement) but not essential; modal operators in the prefix have rather a rhetoric value; they serve to emphasize that what is expressed in their scope is not possible. After using modal principle T (the medieval principle *ab necesse ad esse valet consequentia*), the interdefinability of \Box and \diamondsuit and propositional logic, we obtain simply $A \rightarrow B$.

As for *B* it introduces implicitly the notion of existence in reality as opposed to being in the understanding; in II.13 it is used 'exists' explicitly. Thus it may be formalised either as Ex or $\exists xRx$ or $\exists xEx$.

ヘロマ ヘビマ ヘビマ

II.10:

II.10:

For if it is even in the understanding alone, it can be conceived to exist in reality also, which is greater.

II.10:

For if it is even in the understanding alone, it can be conceived to exist in reality also, which is greater.

 $A \wedge \neg B \rightarrow C$.

II.10:

For if it is even in the understanding alone, it can be conceived to exist in reality also, which is greater.

 $A \wedge \neg B \rightarrow C$. It is the second premiss of AA, appearing directly after stating the goal (II.9) with explicit characterisation of its role as a justification of it ('For ...'). The antecedent is just the (modally free) statement of what was denied in II.9

For if it is even in the understanding alone, it can be conceived to exist in reality also, which is greater.

 $A \wedge \neg B \rightarrow C$. It is the second premiss of AA, appearing directly after stating the goal (II.9) with explicit characterisation of its role as a justification of it ('For ...'). The antecedent is just the (modally free) statement of what was denied in II.9 C may be understood in two ways:

than $i x \varphi(x)$;

For if it is even in the understanding alone, it can be conceived to exist in reality also, which is greater.

 $A \wedge \neg B \rightarrow C$. It is the second premiss of AA, appearing directly after stating the goal (II.9) with explicit characterisation of its role as a justification of it ('For ...'). The antecedent is just the (modally free) statement of what was denied in II.9 C may be understood in two ways: 1. as stating that the thing which is the existing $ix\varphi(x)$ is greater

For if it is even in the understanding alone, it can be conceived to exist in reality also, which is greater.

 $A \wedge \neg B \rightarrow C$. It is the second premiss of AA, appearing directly after stating the goal (II.9) with explicit characterisation of its role as a justification of it ('For ...'). The antecedent is just the (modally free) statement of what was denied in II.9 C may be understood in two ways:

1. as stating that the thing which is the existing $i \times \varphi(x)$ is greater than $i \times \varphi(x)$;

2. as stating that there is an object (not necessarily existing $ix\varphi(x)$) greater than $ix\varphi(x)$ (Barnes, OZ).

For if it is even in the understanding alone, it can be conceived to exist in reality also, which is greater.

 $A \wedge \neg B \rightarrow C$. It is the second premiss of AA, appearing directly after stating the goal (II.9) with explicit characterisation of its role as a justification of it ('For ...'). The antecedent is just the (modally free) statement of what was denied in II.9 C may be understood in two ways:

1. as stating that the thing which is the existing $i \times \varphi(x)$ is greater than $i \times \varphi(x)$;

2. as stating that there is an object (not necessarily existing $ix\varphi(x)$) greater than $ix\varphi(x)$ (Barnes, OZ).

I follow interpretation 1. because such a formalisation of II.10 is closer to Anselm's formulation. In particular it seems that II.11 is based on such interpretation and does not make sense if we assume that the thing greater than $ix\varphi(x)$ is something else.

II.11:

II.11:

Thus if that than which a greater cannot be conceived is in the understanding alone, then that than which a greater cannot be conceived is itself that than which a greater can be conceived.

II.11:

Thus if that than which a greater cannot be conceived is in the understanding alone, then that than which a greater cannot be conceived is itself that than which a greater can be conceived.

 $A \wedge \neg B \rightarrow D.$

II.11:

Thus if that than which a greater cannot be conceived is in the understanding alone, then that than which a greater cannot be conceived is itself that than which a greater can be conceived.

 $A \wedge \neg B \rightarrow D$. It is not a separate premiss but is supposed to follow from II.10 ('Thus ...').

II.11:

Thus if that than which a greater cannot be conceived is in the understanding alone, then that than which a greater cannot be conceived is itself that than which a greater can be conceived.

 $A \wedge \neg B \rightarrow D$. It is not a separate premiss but is supposed to follow from II.10 ('Thus ...').

It seems to be used only for expressing the effect of II.10 (premiss 2) in a more evident way. It just says that if the antecedent of premiss 2 holds, then we obtain D which is the identity of contradictory descriptions which follows by transitivity from premiss 2, providing the consequent of premiss 2 leads directly to contradiction. So in the formal proof we do not need to deal with it explicitly.

II.11:

Thus if that than which a greater cannot be conceived is in the understanding alone, then that than which a greater cannot be conceived is itself that than which a greater can be conceived.

 $A \wedge \neg B \rightarrow D$. It is not a separate premiss but is supposed to follow from II.10 ('Thus ...').

It seems to be used only for expressing the effect of II.10 (premiss 2) in a more evident way. It just says that if the antecedent of premiss 2 holds, then we obtain D which is the identity of contradictory descriptions which follows by transitivity from premiss 2, providing the consequent of premiss 2 leads directly to contradiction. So in the formal proof we do not need to deal with it explicitly.

On the other hand, its occurrence in AA supports rather interpretation 1 of II.10.

II.12, II.13:

Andrzej Indrzejczak Russellian Logic of Definite Descriptions and Anselm's God

But surely this cannot be.

Thus without doubt something than which a greater cannot be conceived exists, both in the understanding and in reality.

< ロ > < 同 > < 三 > < 三 > 、

But surely this cannot be.

Thus without doubt something than which a greater cannot be conceived exists, both in the understanding and in reality.

II.12 simply states that D is contradictory: $D
ightarrow \bot$

But surely this cannot be.

Thus without doubt something than which a greater cannot be conceived exists, both in the understanding and in reality.

II.12 simply states that D is contradictory: $D \rightarrow \bot$ On this basis we obtain by modus tollens $Eix\varphi$, hence the conclusion in sentence II.13 follows which is $A \wedge B$.

< ロ > < 同 > < 回 > < 回 > .

But surely this cannot be.

Thus without doubt something than which a greater cannot be conceived exists, both in the understanding and in reality.

II.12 simply states that D is contradictory: $D \rightarrow \bot$ On this basis we obtain by modus tollens $Eix\varphi$, hence the conclusion in sentence II.13 follows which is $A \wedge B$.

Therefore the crucial thing is to show that C (on whaterver interpretation) leads to contradiction, and this step requires the application of proper logic of DD.

イロト イポト イヨト イヨト

Ontological Argument

The overall structure:

Andrzej Indrzejczak Russellian Logic of Definite Descriptions and Anselm's God

Ontological Argument

The overall structure:

1.	А	(sentence II.8, premiss 1)
Show:	$\Box \neg \diamondsuit (A \land \neg B)$	(sentence II.9, the goal)
2.	$A \wedge \neg B \to C$	(sentence II.10, premiss 2)
2.1.	$A \wedge \neg B$	assumption
2.2.	С	2,2.1
2.3.	D	(supposed to follow from 2.2.)
3.	$A \wedge \neg B o D$	(sentence II.11, by 2.1–2.3)
4.	$D ightarrow \perp$	(sentence II.12)
5.	$\neg (A \land \neg B)$	3,4
6.	В	1,5
7.	$A \wedge B$	(sentence II.13) 1,6

where A states that God (i.e. respective DD) is in the understanding, B that it does not exist in reality, C that 'it can be conceived to exist in reality also, which is greater', D states the identity of two contradictory descriptions.

 $\forall E$ and $\exists I$ are applied with no restrictions (contrary to what is admitted in RDD or FL) like in classical logic (so it may be admitted only in the Fregean logic of DD). Barnes assumes that 21 is contradictory but it is not; we need also: $\neg \exists yyI : Gzix\varphi := \neg \exists yyI : Gzix\neg \exists yyI : Gzx$ but this is not a thesis; it is derivable in Fregean DD (the logic suggested by unrestricted application of $\forall E$ and $\exists I$) if we have $\exists_1 x \varphi$ or in FL if we have $\exists y(y = ix\varphi)$ (in RDD it does not matter; they are equivalent).

Barnes' Pr 4, corresponding to II.10 is very strong; it leads to $\forall z(Ez \rightarrow Gzix\varphi)$.

It seems that introducing two forms of I: is not necessary; in the proof it is always used as having a formula as the second argument.

< ロ > < 同 > < 回 > < 回 >

 $\forall E$ and $\exists I$ are applied with no restrictions (contrary to what is admitted in RDD or FL) like in classical logic (so it may be admitted only in the Fregean logic of DD). Barnes assumes that 21 is contradictory but it is not; we need also: $\neg \exists yyI : Gzix\varphi := \neg \exists yyI : Gzix\neg \exists yyI : Gzx$ but this is not a thesis; it is derivable in Fregean DD (the logic suggested by unrestricted application of $\forall E$ and $\exists I$) if we have $\exists_1 x \varphi$ or in FL if we have $\exists y(y = ix\varphi)$ (in RDD it does not matter; they are equivalent).

Barnes' Pr 4, corresponding to II.10 is very strong; it leads to $\forall z(Ez \rightarrow Gzix\varphi)$.

It seems that introducing two forms of I: is not necessary; in the proof it is always used as having a formula as the second argument. Also his rule RImag is not necessary if we correct God's description.

Andrzej Indrzejczak Russellian Logic of Definite Descriptions and Anselm's God

Weak points: in contrast to OZ this is not a diagonal argument; the character of φ_2 has nothing to do here.

< ロ > < 同 > < 回 > < 回 > .

Weak points: in contrast to OZ this is not a diagonal argument; the character of φ_2 has nothing to do here. In fact the proof goes even if we use the following premiss 2: $\forall x(Cx \land \neg Ex \rightarrow \Diamond Ciz(Ez \land z = x) \land Giz(Ez \land z = x)x)$

・ 同 ト ・ ヨ ト ・ ヨ ト

Weak points: in contrast to OZ this is not a diagonal argument; the character of φ_2 has nothing to do here. In fact the proof goes even if we use the following premiss 2: $\forall x(Cx \land \neg Ex \rightarrow \Diamond Ciz(Ez \land z = x) \land Giz(Ez \land z = x)x)$ Hence it is also very general not specifically based on God description.

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

Weak points: in contrast to OZ this is not a diagonal argument; the character of φ_2 has nothing to do here.

In fact the proof goes even if we use the following premiss 2:

$$\forall x (Cx \land \neg Ex \to \Diamond C \imath z (Ez \land z = x) \land G \imath z (Ez \land z = x) x)$$

Hence it is also very general not specifically based on God description.

On the other hand, note that if we change Pr 1 with OZ Pr 1, or simplify the antecedent of Pr 2 (as in OZ), nothing changes; the proof goes as before since $Cix\varphi$ is used only in propositional inferences so A of any shape will do.

It seems that to validate OZ we need full strength of RA, whereas for this proof of AA RA^{\rightarrow} is enough. But ...

Andrzej Indrzejczak Russellian Logic of Definite Descriptions and Anselm's God

The Weakest Logic validating AA:

RA^{\rightarrow} reformulated:

Andrzej Indrzejczak Russellian Logic of Definite Descriptions and Anselm's God

イロト イポト イヨト イヨト

So it seems that the weakest logic for AA is pure FOLI with RA^{\rightarrow} .

Andrzej Indrzejczak Russellian Logic of Definite Descriptions and Anselm's God

< 同 > < 三 > < 三 >

So it seems that the weakest logic for AA is pure FOLI with RA^{\rightarrow} . But let us examine it a bit further; we can replace RA^{\rightarrow} with three axioms:

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

So it seems that the weakest logic for AA is pure FOLI with RA^{\rightarrow} . But let us examine it a bit further; we can replace RA^{\rightarrow} with three axioms:

$$\begin{array}{l} \mathsf{RAa} \ \psi(\imath x \varphi) \to \exists x \varphi \\ \mathsf{RAb} \ \psi(\imath x \varphi) \to \forall x (\varphi \to \psi(x)) \\ \mathsf{RAc} \ \psi(\imath x \varphi) \to \forall x y (\varphi \land \varphi(y) \to x = y) \end{array}$$

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

So it seems that the weakest logic for AA is pure FOLI with RA^{\rightarrow} . But let us examine it a bit further; we can replace RA^{\rightarrow} with three axioms:

$$\begin{array}{l} \mathsf{RAa} \ \psi(\imath x \varphi) \to \exists x \varphi \\ \mathsf{RAb} \ \psi(\imath x \varphi) \to \forall x (\varphi \to \psi(x)) \\ \mathsf{RAc} \ \psi(\imath x \varphi) \to \forall x y (\varphi \land \varphi(y) \to x = y) \end{array}$$

Do we really need all of them to prove AA?

▲ 同 ▶ ▲ 国 ▶ ▲ 国 ▶

So it seems that the weakest logic for AA is pure FOLI with RA^{\rightarrow} . But let us examine it a bit further; we can replace RA^{\rightarrow} with three axioms:

$$\begin{array}{l} \mathsf{RAa} \ \psi(\imath x \varphi) \to \exists x \varphi \\ \mathsf{RAb} \ \psi(\imath x \varphi) \to \forall x (\varphi \to \psi(x)) \\ \mathsf{RAc} \ \psi(\imath x \varphi) \to \forall x y (\varphi \land \varphi(y) \to x = y) \end{array}$$

Do we really need all of them to prove AA? Let us analyse OZ again:

4.	\bot	3.1-3.5, by discharge of 3.1

only RAa and RAb is needed.

Russellian Logic of Definite Descriptions and Anselm's God

.

Another proof of my formalisation:

Andrzej Indrzejczak Russellian Logic of Definite Descriptions and Anselm's God

Another proof of my formalisation:				
1.	$\neg Eix \varphi_2$	ind. ass.		
2.	$C\imath x\varphi_2$	Pr 1		
3.	$C\imath x \varphi_2 \wedge \neg E\imath x \varphi_2 \rightarrow$			
	$\Diamond C \imath z (Ez \land z = \imath x \varphi_2) \land G \imath z (Ez \land z = \imath x \varphi_2) \imath x \varphi_2$	Pr 2		
4.	$\Diamond C\imath z (Ez \land z = \imath x \varphi_2) \land G\imath z (Ez \land z = \imath x \varphi_2) \imath x \varphi_2$	1, 2, 3		
5.	$G\imath z(Ez \wedge z = \imath x \varphi_2)\imath x \varphi_2$	4		
6.	$\exists z (Ez \land z = \imath x \varphi_2)$	5, RAa		
6.1.	$E_{a} \wedge a = \imath x \varphi_{2}$	6, ex. ass		
6.2.	Ea	6.1		
6.3.	$a = i x \varphi_2$	6.2		
6.4.	$Eix\varphi_2$	6.2, 6.3		
7.	$E_{ix}\varphi_{2}$	6.1–6.4		

<ロ> (日) (日) (日) (日) (日)

Another proof of my formalisation:				
1.	$\neg Eix \varphi_2$	ind. ass.		
2.	$C\imath x\varphi_2$	Pr 1		
3.	$C\imath x \varphi_2 \wedge \neg E\imath x \varphi_2 \rightarrow$			
	$\Diamond C\imath z (Ez \land z = \imath x \varphi_2) \land G\imath z (Ez \land z = \imath x \varphi_2) \imath x \varphi_2$	Pr 2		
4.	$\Diamond C \imath z (Ez \land z = \imath x \varphi_2) \land G \imath z (Ez \land z = \imath x \varphi_2) \imath x \varphi_2$	1, 2, 3		
5.	$G\imath z(Ez \wedge z = \imath x \varphi_2)\imath x \varphi_2$	4		
6.	$\exists z (Ez \land z = \imath x \varphi_2)$	5, RAa		
6.1.	$E_a \wedge a = \imath x \varphi_2$	6, ex. as		
6.2.	Ea	6.1		
6.3.	$a = i x \varphi_2$	6.2		
6.4.	$E_{ix}\varphi_{2}$	6.2, 6.3		
7.	$E_{ix}\varphi_{2}$	6.1–6.4		

Only RAa is necessary! So objectively my formalisation requires even weaker logic than OZ.

Other logics validating AA? - The role of premiss 1

Other logics validating AA? - The role of premiss 1

It seems that both in the approach of OZ and in mine, RDD is a logic that works.

Other logics validating AA? - The role of premiss 1

It seems that both in the approach of OZ and in mine, RDD is a logic that works.

Other logics validating AA? - The role of premiss 1

It seems that both in the approach of OZ and in mine, RDD is a logic that works.

However we have focused on the role of premiss 2 (II.10). What if we consider changing premiss 1? There are at least the following choices:

1 $Cix\varphi$ (mine)

Other logics validating AA? - The role of premiss 1

It seems that both in the approach of OZ and in mine, RDD is a logic that works.

- $Cix\varphi$ (mine)
- **2** $\exists x \varphi$ (OZ; it actually follows from mine by RA^{\rightarrow} or RAa)

Other logics validating AA? - The role of premiss 1

It seems that both in the approach of OZ and in mine, RDD is a logic that works.

- $Cix\varphi$ (mine)
- **2** $\exists x \varphi$ (OZ; it actually follows from mine by RA^{\rightarrow} or RAa)
- $\exists x(x = \imath x \varphi)$ (it follows from mine by SA)

Other logics validating AA? - The role of premiss 1

It seems that both in the approach of OZ and in mine, RDD is a logic that works.

- $Cix\varphi$ (mine)
- **2** $\exists x \varphi$ (OZ; it actually follows from mine by RA^{\rightarrow} or RAa)
- $\exists x(x = \imath x \varphi)$ (it follows from mine by SA)
- $\textcircled{3} \exists_1 x \varphi$

Other logics validating AA? - The role of premiss 1

It seems that both in the approach of OZ and in mine, RDD is a logic that works.

However we have focused on the role of premiss 2 (II.10). What if we consider changing premiss 1? There are at least the following choices:

- $Cix\varphi$ (mine)
- **2** $\exists x \varphi$ (OZ; it actually follows from mine by RA^{\rightarrow} or RAa)
- $\exists x(x = \imath x \varphi)$ (it follows from mine by SA)
- $\textcircled{3} \exists_1 x \varphi$

Note that if we take 3 as premiss 1, then AA is valid in PFL, since $\vdash \exists x(x = \imath x \varphi) \rightarrow \varphi(\imath x \varphi)$

Other logics validating AA? - The role of premiss 1

It seems that both in the approach of OZ and in mine, RDD is a logic that works.

However we have focused on the role of premiss 2 (II.10). What if we consider changing premiss 1? There are at least the following choices:

- $Cix\varphi$ (mine)
- **2** $\exists x \varphi$ (OZ; it actually follows from mine by RA^{\rightarrow} or RAa)
- $\exists x(x = \imath x \varphi)$ (it follows from mine by SA)
- $\textcircled{3} \exists_1 x \varphi$

Note that if we take 3 as premiss 1, then AA is valid in PFL, since $\vdash \exists x(x = ix\varphi) \rightarrow \varphi(ix\varphi)$ If we take 4, then AA is valid in Frege logic of DD, since $\vdash \exists_1 x \varphi \rightarrow \varphi(ix\varphi)$

Other logics validating AA? – The role of premiss 1

It seems that both in the approach of OZ and in mine, RDD is a logic that works.

However we have focused on the role of premiss 2 (II.10). What if we consider changing premiss 1? There are at least the following choices:

- $Cix\varphi$ (mine)
- **2** $\exists x \varphi$ (OZ; it actually follows from mine by RA^{\rightarrow} or RAa)

3
$$\exists x(x = ix\varphi)$$
 (it follows from mine by SA)

 $\textcircled{3} \exists_1 x \varphi$

Note that if we take 3 as premiss 1, then AA is valid in PFL, since $\vdash \exists x(x = ix\varphi) \rightarrow \varphi(ix\varphi)$ If we take 4, then AA is valid in Frege logic of DD, since $\vdash \exists_1 x\varphi \rightarrow \varphi(ix\varphi)$ However, note that in the first formalisation of OZ $\exists_1 x\varphi$ follows from $\exists x\varphi$ by connectedness of *G*.
